(57) Abstract :
ABSTRACT SYSTEM AND METHOD FOR AUTOMATED WATER TANK LEVEL MONITORING AND PUMP CONTROL USING INTERNET OF THINGS A computer-implemented system for automated water tank level monitoring and pump control using Internet of Things technology is disclosed. The system comprises a processor coupled to a memory storing executable instructions implementing multiple functional modules. The system further comprises a sensor data acquisition module configured to collect real-time water level data using ultrasonic distance measurement technology continuously monitoring water surface distance and converting distance measurements into water level percentages. The system comprises a water level analysis module processing the water level data to determine tank status by comparing measured levels against predefined thresholds. The system further comprises a pump automation module controlling water pump operation through relay switching circuits, activating the pump when levels fall below a lower threshold and deactivating when levels exceed an upper threshold. The system provides technical advantages including elimination of mechanical wear through contactless sensing, reduced pump cycling frequency extending equipment lifetime.
